1 Introduction

Safety Monitor Pro (SM Pro) is a single WHM plugin that gives a hosting administrator a live, actionable view of server health and security — and the one-click tools to act on it.

- ✓ Real-time server health, load & processes
- ✓ Intrusion & web-attack monitoring
- ✓ Outbound spam & phishing defense
- ✓ Server Tune-up with an optimization score
- ✓ AI-assisted diagnosis & fixes (bring your own key)
- ✓ Firewall (CSF/LFD) status & controls
- ✓ Forensics / malware audit per account
- ✓ Site Doctor — detect & auto-fix down sites
- ✓ WhatsApp / Telegram / email alerts
- ✓ Manage many servers from one Hub

2 Requirements

- ✓ A server running **WHM / cPanel** (AlmaLinux, CloudLinux, Rocky or Ubuntu)
- ✓ Outbound HTTPS to the license/update server
- ✓ **Root** access (the installer runs as root)
- ✓ A valid **license key** (from your purchase email / WhatsApp)

3 Installation

You receive your license key and a one-line installer by email / WhatsApp the moment your serial is created. As **root**, paste it into your server's terminal:

```
curl -fsSL -A "Mozilla/5.0 …SafetyMonitorPro/installer" https://<license-host>/install.sh | bash -s -- YOUR-LICENSE-KEY
```

1. The installer reads your server's main IP and a hardware fingerprint and requests your signed copy of the plugin.
2. The package is verified (checksum) and extracted, and the WHM plugin is registered automatically.
3. Open **WHM → Plugins → Safety Monitor Pro** — you're taken to the License page to finish activation.

> **Tip:** the installer is tied to your key + this server. Each key installs on one server; contact support to move a license to a new machine.

4 Activating your license

On first open, the License page shows your server identity and activates automatically against your key. A green banner confirms the license is valid; features unlock based on your plan.

5 The Dashboard

The Dashboard is your at-a-glance command center: key metrics on top, then recent activity and health breakdowns. Use the quick-action buttons to jump to any tool.

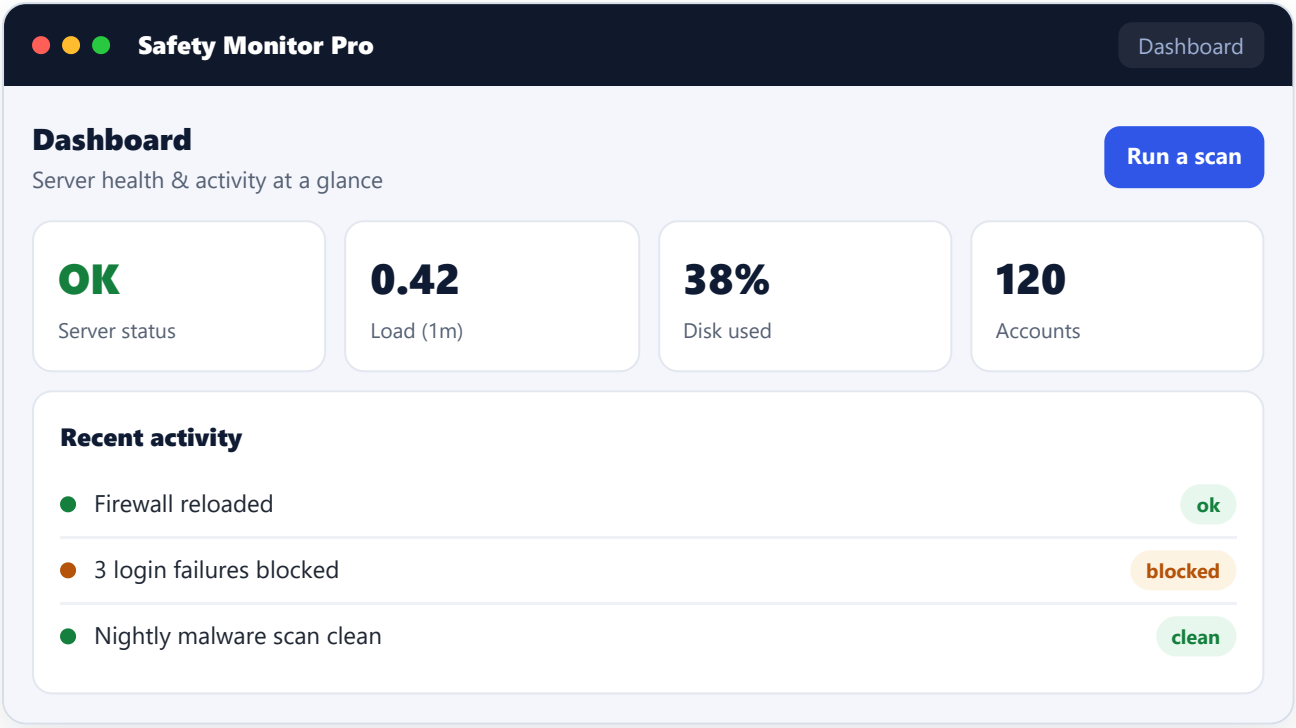

Illustration — Dashboard overview

6 Monitoring

Live insight into the things that take a server down: **Server Health**, **Load Monitor**, **Top Processes**, **Disk / Storage**, **Network Traffic**, **Hardware & Platform** and **cPanel Services**. Spot a runaway process or a full disk before customers notice.

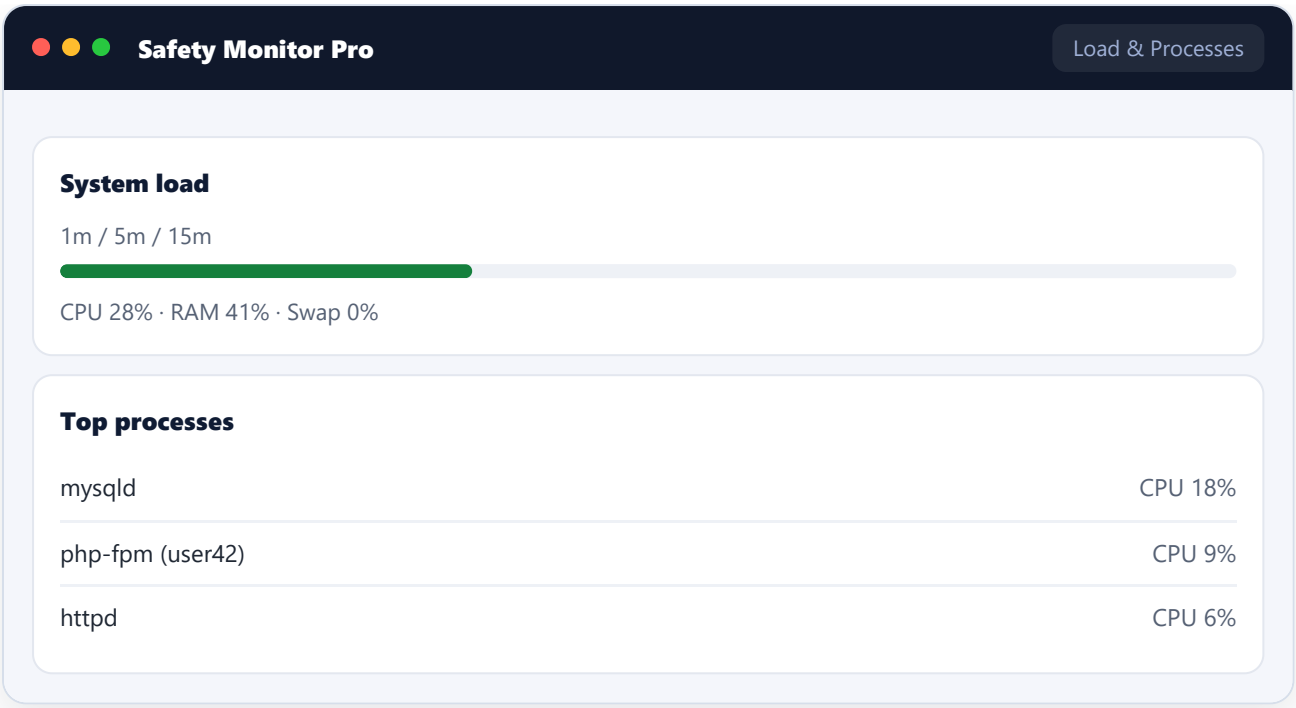

Illustration — Load & top processes

How to use

1. Open the relevant monitoring page from the menu.
2. Watch the live values; red/amber means attention needed.
3. Drill into Top Processes to find what's consuming CPU/RAM.

7 Security & firewall

SM Pro brings your defenses into one place: **Firewall Status** (CSF/LFD), **Account Audit** (logins & suspicious access), **Intrusion Monitor** (web attacks / Imunify), **Forensics / Audit** (per-account malware), **PHP Harden**, and a **Security Health** checklist.

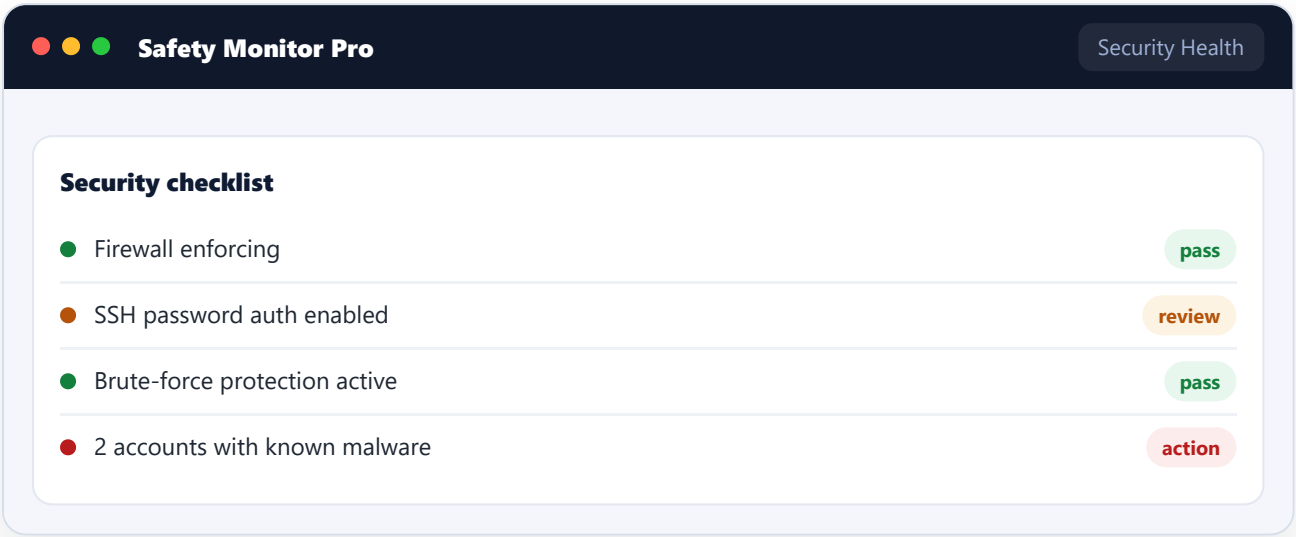

Illustration — Security Health checklist

How to use

1. Review the checklist — each item shows the current state + a recommendation.
2. For findings, follow the in-page guidance or open Forensics to quarantine affected files.
3. Use Firewall Status to confirm CSF is enforcing and your IP is allowlisted.

> **Caution:** changes that affect SSH/firewall access show a red warning — keep your current session open and verify a new login before closing it.

8 Mail abuse protection

Spam & Phishing surfaces accounts sending abnormal volumes, watches the mail queue, and helps you hold or suspend a compromised account before your IPs get blacklisted.

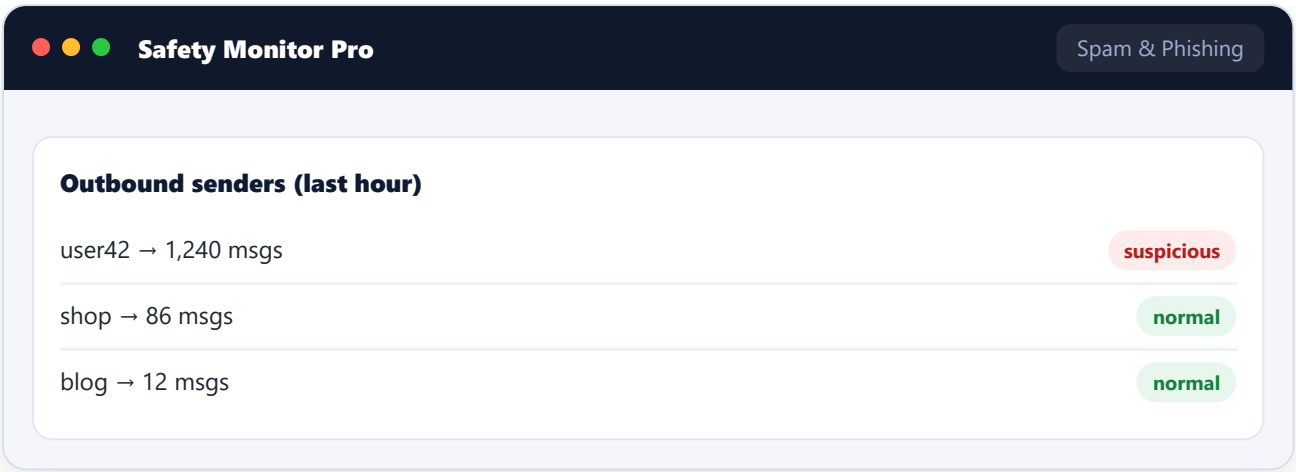

Illustration — outbound spam detection

9 Site Doctor

Site Doctor checks a domain end-to-end (DNS → HTTP → redirects) and, when a site is down or stuck in a redirect loop, proposes — and can apply — a fix. It un-hardens locked files first, applies fixes incrementally, and re-checks until the site is up.

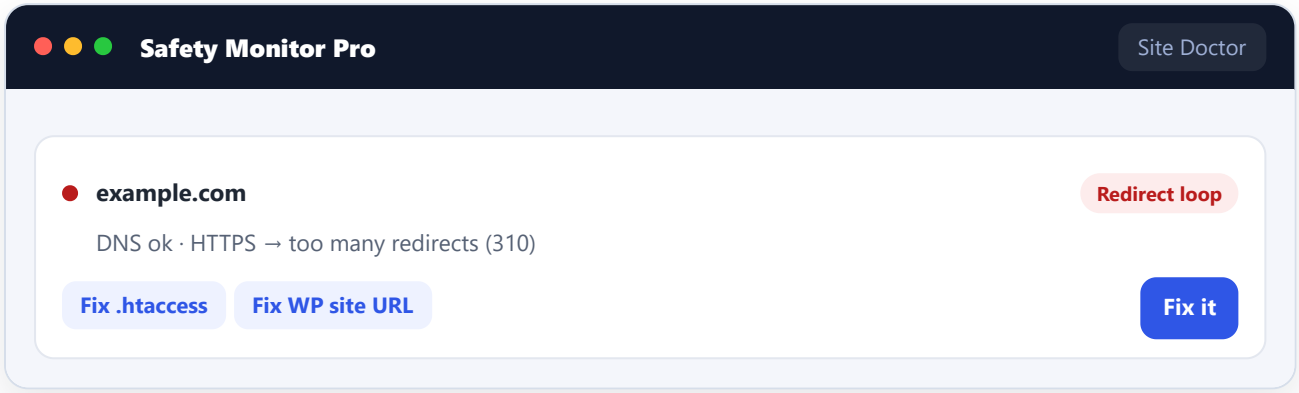

Illustration — Site Doctor diagnosis & fix

How to use

1. Enter or pick a domain → Site Doctor runs the checks.
2. Review the diagnosis and the proposed fixes.
3. Click **Fix it** — fixes are applied incrementally and verified; everything is reversible.

10 Server Tune-up

The Tune-up page scans your engines (MySQL, Apache, PHP, CSF, Imunify, SSH) and lists safe performance & security improvements. An **Optimization score** sits at the top; each time you apply a recommendation it disappears and the score rises. Every change is backed up, validated, and reversible.

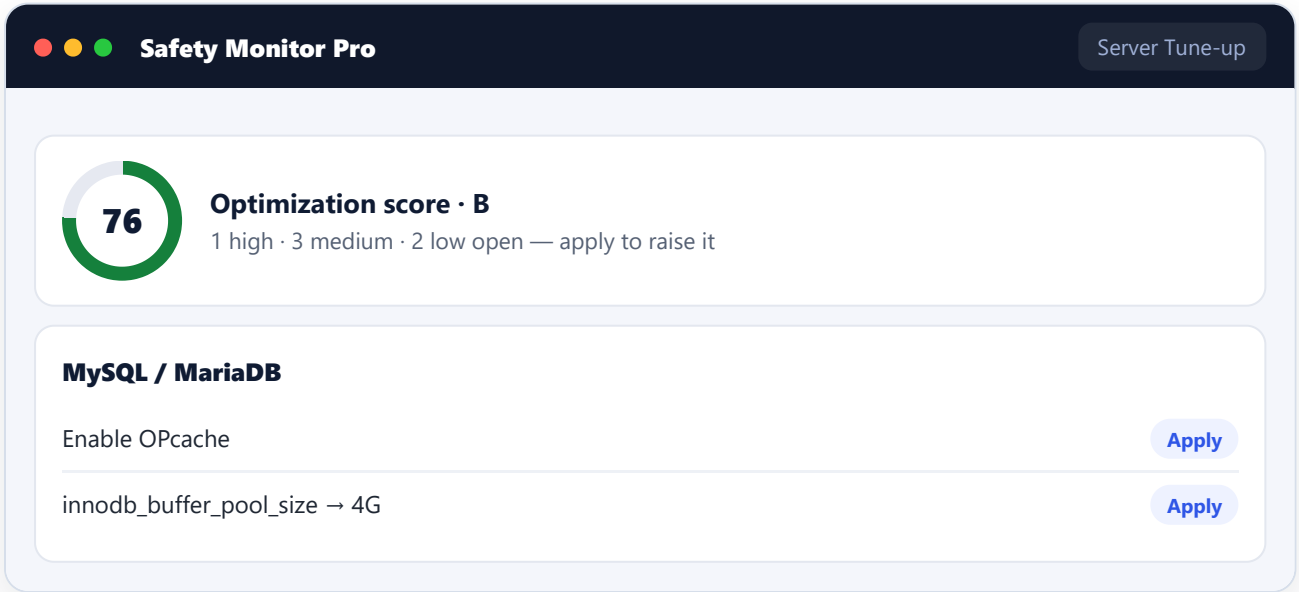

Illustration — Tune-up with optimization score

How to use

1. Open Server Tune-up — review your score and the open recommendations.
2. Click **Apply** on any item — it's backed up, applied, validated, then removed from the list.
3. Or use **AI optimize** to get tailored, safety-flagged suggestions for selected engines.

11 Alerts & notifications

Get told the moment something matters — via **WhatsApp**, **Telegram** or **email**. Connect a channel once, choose which events alert you, and SM Pro batches emergencies so you're not spammed.

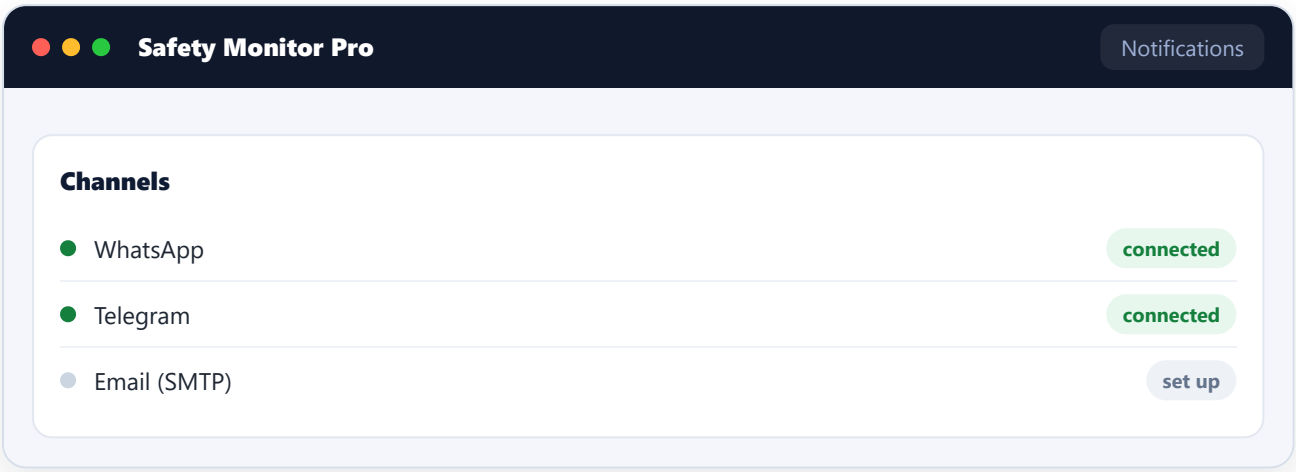

Illustration — alert channels

12 Multi-Server Hub

On the top plan, link several servers and watch them from one place — a single status board across your fleet, with each box reporting its health, version and alerts back to the Hub by mutual consent.

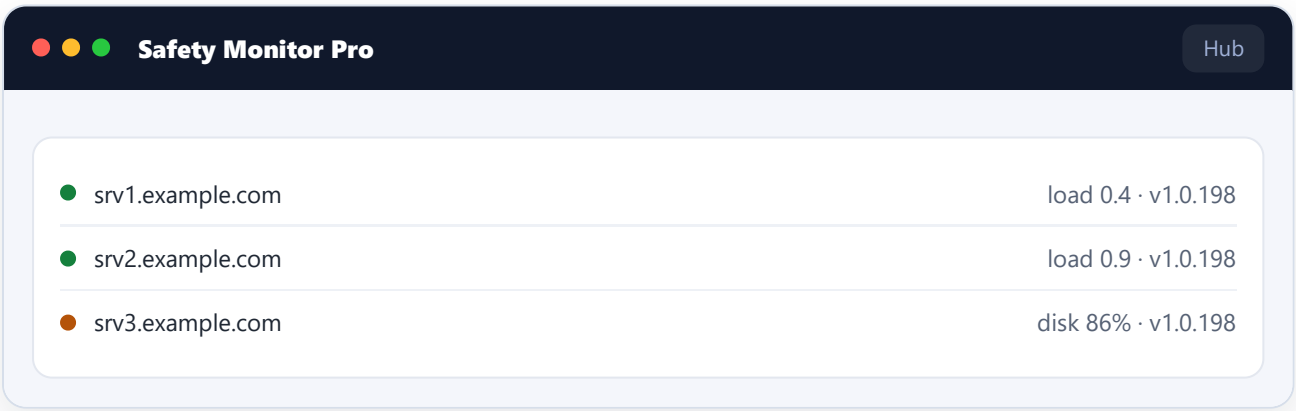

Illustration — fleet view

13 Updates

SM Pro updates itself securely: every release is cryptographically signed and integrity-checked before it's applied. Turn on auto-update to always run the latest, or update manually from the Updates page.

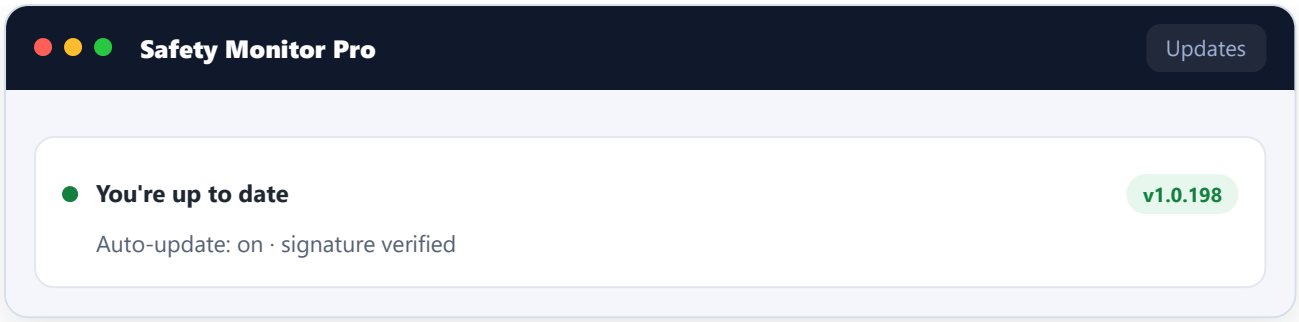

Illustration — Updates

14 Tips & best practices

- ✓ Keep auto-update on for the latest fixes.
- ✓ Connect WhatsApp/Telegram so you hear about issues instantly.
- ✓ Use Site Doctor first when a customer reports a down site.
- ✓ Add your own IP to the firewall allowlist before enforcing.
- ✓ Run Server Tune-up after install to raise your score.
- ✓ Add an AI provider key to unlock guided fixes.

15 FAQ & support

Can I move my license to another server?

Each key is bound to one server. Contact support to release and re-bind it to a new machine.

Will applying a fix break my server?

No — every apply is backed up first, validated, and reversible. Access-risk changes (SSH/firewall) always require explicit confirmation.

What happens if the license server is briefly unreachable?

Nothing — the plugin keeps running on a grace period and recovers automatically when the connection returns.

How do I get help?

Use the support contact from your purchase. Have your license key and server hostname ready.
